Such instruments generally include a sound producing body and at least one string attached to the body. As the strings are plucked or strummed, they vibrate causing the body to vibrate. In some cases, the strings are attached to a bridge or the sound producing body includes a neck and the strings are attached to a fretboard located along the neck. Various types of guitars have been constructed that have a neck and fretboard having an increased radius. As the radius of a neck increases, a player's finger or fingers span a greater distance to reach the fretboard. As a result, the fingers are stretched and the force with which the fingers strike the strings is increased. Consequently, the tone quality of the instrument is improved. However, many people find the increased length of the neck, and consequently increased span of a person's fingers, to be uncomfortable. This is especially true when playing an instrument for long periods of time. Thus, it would be desirable to provide a guitar having a neck with an increased radius of curvature and a fretboard that is relatively shorter than the increased radius neck and that includes strings that do not interfere with the ability of the person to play the instrument for extended periods of time.A known configuration of a platelet trapping filter in the form of a flat membrane mounted on a frame has an inlet and an outlet. In the region of the flat membrane are provided openings which are smaller than the diameter of the blood cells, so that the blood cells are retained by the membrane and collect in the area of the openings. For obtaining a sufficient yield of platelets, a predetermined amount of platelets in the blood is thus to be filtered in this filter, which amount is retained in the 82157476af
